Cyber Security as a Service

All-in-One Solutions

Cyvatar is here to eliminate the noise, alerts, and vulnerability reports that don't provide measurable outcomes. We're here to set you up for success.

Cyvatar is a technology-enabled cyber security as a service (CSaaS) provider disrupting a $150 billion industry by introducing and delivering smarter, measurable subscriptions to help you achieve compliance and security faster and more efficiently.

We take on the heavy lifting without requiring you to invest in additional resources. That means our cyber avatars have installed, configured, assessed, and remediated your environment and are now maintaining it before you've completed most traditional POCs. We track your progress and provide monthly executive level reporting on achievement against industry-recognized benchmarks and best practices.

- We **replace your VAR** and work as an ongoing, strategic partner helping to drive revenue and business outcomes.

- We **replace your MSSP** by delivering a return on your security investments.

- We **replace your security services partner** by giving you ongoing assessment, penetration testing, and maintenance throughout the length for your subscription.

- We **address your security skills gaps and staff shortages** with the hands-on expertise of our solution consultants.

ICARM Methodology

Install & Configure
The solution is installed and configured into the environment and Cyvatar ensures that it is operating effectively and efficiently in compliance with best practices.

Remediation
We do more than just report on alerts. Based upon the results of the assessment, Cyvatar works with your team to remediate any risks identified.

Assessment
Once the technology is up and running, Cyvatar will assess the environment to identify risks and vulnerabilities.

Maintenance
Cyvatar is with you during the duration of the subscription to maintain compliance and your security outcomes including monthly executive level reporting.

Solution Portfolio

Comprehensive solutions to meet your most complex compliance and security needs.

Cyvatar recognized the need to engage differently with our customers and created subscriptions that combine the people, processes, and technology to help customers across the goal line and to deliver value and measurable outcomes to your board.

We have thoughtfully built out our subscriptions to help you meet compliance requirements as well as achieve "real" security within your environment. When you choose a Cyvatar subscription solution – you're investing in evolution, your future, and sustainable success.

Application Security Management (ASM)
Continually monitor and fix security vulnerabilities in your applications, protecting your users and data from cyber threats.

Cloud Infrastructure Management (CIM)
Streamline cloud security and enforce policies throughout the entire development lifecycle.

Cloud SaaS Management (CSM)
Gain complete visibility in to your environment and reduce risk across your cloud environments.

Compliance & Policy Management (CPM)
Manage security policy, compliance, and enforcement to deliver a strong security posture.

Continuous Security Validation (CSV)
Get the peace of mind that your security controls are functioning and effective across your organization.

Email & Browser Management (EBM)
Minimize the risks associated with email clients, phishing, and business email compromise as well as reduce web-based threats associated with users.

Incident Response Management (IRM)
Ensure you have the resiliency in your people, processes, and technology to react quickly and effectively when an incident occurs.

Incident Response Retainer (IRR)
Enable faster and more effective response by establishing terms and conditions before a cyber incident is suspected.

IT Asset Management (ITAM)
Gain confidence in knowing the technology assets you have, where they reside, and which are most critical to your business.

Managed SOAR (MSOAR)
Quickly and efficiently identify, analyze, and automatically remediate key operational security risks across your organization.

Multi Factor Authentication Management (MFA)
Reduce the risk from unauthorized access to business accounts and data.

Privilege Access Management (PAM)
Reduce risk from over-privileged users and prevent lateral movement across your enterprise.

Security Awareness Management (SAM)
Improve the awareness for information security, cybersecurity, intellectual property protection, privacy, and business continuity.

Secure Endpoint Management (SEM)
Reduce the key security risks associated with malware on endpoints and insider threats before they impact your business.

Threat & Vulnerability Management (TVM)
Continuously reduce the cyber security risks associated with your internal and external infrastructure.
